OE 2014 Schield Creating Distributions Empirically 2

## Generating Distributions

---

In introductory statistics, students are shown how the means of random samples form a sampling distribution that -- in the limit -- forms a Normal distribution.

This is extremely useful in sampling. But the Normal distribution applies in situations that do not involve sampling – as do the Log-Normal and Exponential.

Certain kinds of random activity can be shown to generate these well-known analytic distributions.

Understanding how this happens can be very useful to managers making data-based decisions.

OE 2014 Schield Creating Distributions Empirically 3

## Generating Distributions: Normal, Log-Normal & Exponential

---

Mathematicians have proven:

1. The sum of an infinite number of independent random variables generates a Normal distribution
2. The product of an infinite # of random, independent, positive variables generates a Log-Normal distribution
3. A random process of assigning counts to cells in a table can generate a chi-square distribution.
4. A process having a constant chance of ‘death’ generates an exponential distribution.

Amazing! At the micro level, pure randomness. At the macro level, an analytic distribution emerges without any agency or intent. Micro randomness generates macro-order: spontaneous and unplanned.

OE 2014 Schield Creating Distributions Empirically 4

## Generating Distributions Empirically

---

Excel is used to generate these distributions empirically.

The Normal and Log-Normal are the empirical results of 10,000 independent lines of activity. Each line receives:

- An add by a random amount (discrete or continuous) generates a Normal distribution.
- a multiply by a positive random change (discrete or continuous) generates a Log-Normal distribution.

The Chi-square is the empirical result of randomly assign values to cells in a table (keeping the expected values equal) and then compute chi-square for each series.

The Exponential is the empirical result of 2,000 lines of activity; each line has a fixed chance of death per period.

OE 2014 Schield Creating Distributions Empirically 5

## 1a Generating a Normal Dist. Sum of Random Normals

---

$Period1 = Period0 + K * NORM.S.INV(RAND())$

Sum of Random Normals

Period	1	4	9	16	25	36	49
Median	100.02	100.03	100.01	100.04	100.01	100.03	100.04
StdDev	1.00	2.00	3.02	3.16	3.31	3.45	3.60
PredictSD	1	2	3	4	5	6	7

$SD(T) = K * SD(1) * \sqrt{T}$      $SD(1) = 1.$

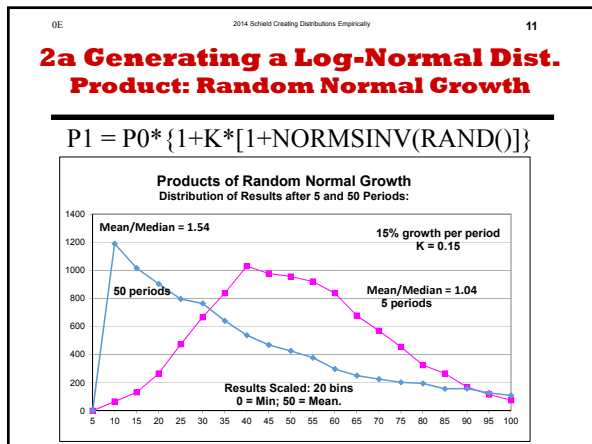

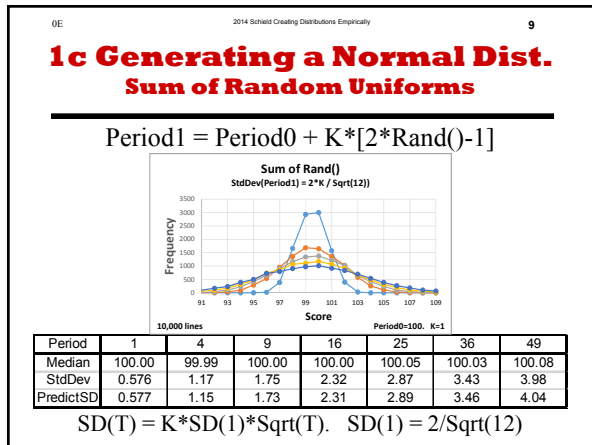

OE 2014 Schield Creating Distributions Empirically 6

## Test for Normality #1 QQ-Plot: Sorted PDF vs Percentile

---

Sum of Random Normals (50 periods)  
Sorted PDF vs Percentile

10,000 Series      Start: 100    K = 1

OE 2014 Schield Creating Distributions Empirically 16

### Conclusion

Knowing the process that generates a distribution is helpful to anyone *who wants to understand why* a given distribution is a good fit in a particular situation. It also helps us *understand what determines* the parameters of a distribution (or changes therein).

Why have these increased over time?

- the standard deviation of heights?
- the mean/median ratio (the skewness) for incomes?
- the economic return from higher education?
- the average lifetime of humans?

OE 2014 Schield Creating Distributions Empirically 17
