- 2009 SERJ: case study of two ELLs
- 2013 SERJ: CLASS survey
- 2015 J . of Technical Writing and Communication: readability of a corpus of college statistics textbooks
- 2016 J. of Computers in Mathematics and Science Teaching: tools to assess readability of teaching materials
- Nov. 2016 SERJ: case study of ELLs using bilingual probability applet

## Question for group discussion

What are some examples
of how language can be challenging
for any student learning probability?

## Definition of ELL

students who experience "enough limitations that he or she cannot fully participate in mainstream English instruction" (Goldenberg, 2008, p. 10), which includes those beginning to learn English who could benefit from language support and those who are proficient in English but may need additional assistance in social or academic situations (Hoffstetter, 2003).

## importance/rationale for topic

- Importance of language
- Spanish is the second-most spoken language in the world and is by far the most common language of ELLs in US
- ELL-friendly teaching practices can help all students

| Question for group discussion |

|  |
|  |

[^0]
## Language in probability: conditional probability <br> Probability of someone testing positive having cancer <br> versus <br> Probability of someone having cancer testing positive

## Culture in probability

- differences on nature or role of randomness (Eglash, 2005)
- Culturally-relevant games (e.g., Toma Todo, la lotería, etc. vs. card games, etc.)
- Manipulatives: "fair die", "draw a card", sides of a coin, "faces" of a coin

## Question for group discussion

What are some examples
of how culture can play a role
in how a student learns probability?

## Culture in probability: Manipulatives

- "fair die": not knowing what a 'fair die' was, an K-12 ELL could not answer "If you rolled a fair die, what is the probability of getting a number less than 3?" $\qquad$
- "draw a card": two 3rd-grade students drew the 6 of spades in their math notebook
- sides of a coin:
college ELL interview excerpt (from Lesser \& Winsor, 2009):
M: The second event is 'quarter lands on tails.'
S2: What is tails on the quarter?
[Mexican coins: seal (or sun) and eagle;
other Latin America: cara[face] y cruz[cross], shield, crown]

## Probability Vocabulary and Concepts

## tossing (asymmetric) moon blocks <br> (can disrupt equiprobability bias)

- each crescent-shaped block has flat(yang) and curved(yin) sides
- used in China, Hong Kong, Taiwan, etc. to indicate - (2 yins) or + (1 of each) fortune
- What's probability of the latter?

## Specific Context: Coin Flipping

- Real-world: decided some precinct delegates in lowa political caucuses, opening NFL kickoffs, etc.
- Statistics: flips are Bernoulli trials, have the simplest equiprobable sample space, are a benchmark for randomness, etc.
- Probability education research reviewed in our 2016 SERJ paper: Falk \& Lann (2015), Rubel (2007), Sedlmeier (1998), Watson \& English (2015), etc.

## multilingual probability resources

- Terms in 29+ languages at http://isi.cbs.nl/glossary
- Multilingual collections of applets (e.g., NLVM or Shodor)

## questions adapted from protocol

- What is the longest run in this sequence?

HTTHHTHHHTTH

- For a 100-flip sequence, how long do you think the longest run will be?

| timeline |  |

## Research Questions

- What is the nature of how Spanishspeaking ELLs use a bilingual applet when learning probability?
- When does it appear that language plays a factor when Spanish-speaking ELLs explore probability with the applet?

## Mock Interviews

- In the next slide, a set of three questions from the protocol are provided
- Do the following:
- Choose roles (interviewer, ELL interviewee, non-ELL interviewee, recorder)
- Stay in character during interviews
- Discuss results (out of character)
- Debrief

## Debrief

- Points of consensus:
- Questions that arose:
- Themes:
from Lesser, Wagler, \& Salazar (2016)

B: in your own words...what does 'longest run' mean to you?

P1: ...the more, the most, hmmmm, the fastest to flip the coin, like [short pause] many times but so fast [nervous laugh]

Multiple meanings of run in statistics

- Difference of $x$-coordinates (e.g., slope is "rise over run")
- A sequence of at least 2 consecutive identical outcomes (e.g., "what is the longest run of heads?")
- In the long run
- Run the [experiment/simulation/program]

Helping English Language Learners Navigate
Probability Vocabulary and Concepts

Another reason to distinguish similar-sounding phrases

- "long run" and "longest run"
- Mean, median, mode: Lesser \& Winsor (2009) \& CLASS survey

## Pedagogical discussion

## Question for group discussion

What are some examples of how language can be challenging for any student learning probability?

## Language in probability: negation location

## Pr(all rolls are not 5's)

## versus

Pr(not all rolls are 5's)

## Language in probability: conditional probability

Probability of someone testing positive having cancer versus

Probability of someone having cancer testing positive

# Language in probability: specifying sets of discrete events 

Sullivan (2010):

## Section 6.2 The Binomial Probability Distribution 347

## Binomial Probability Distribution Function

The probability of obtaining $x$ successes in $n$ independent trials of a binomial experiment is given by

$$
\begin{equation*}
P(x)={ }_{n} C_{x} p^{x}(1-p)^{n-x} \quad x=0,1,2, \ldots, n \tag{1}
\end{equation*}
$$

where $p$ is the probability of success.
While reading probability problems, pay special attention to key phrases that translate into mathematical symbols. Table 9 lists various phrases and their corresponding mathematical equivalent.

## Table 9

| Phrase | Math Symbol |
| :--- | :---: |
| "at least" or "no less than" or "greater than or equal to" | $\geq$ |
| "more than" or "greater than" | $>$ |
| "fewer than" or "less than" | $<$ |
| "no more than" or "at most" or "less than or equal to" | $\leq$ |
| "exactly" or "equals" or "is" | $=$ |

## Language in probability: lexical ambiguity (e.g., the word random) Kaplan, Rogness, Fisher (2014)

Figure Ia. Random Zebras (Colloquial).

Figure Ib. Random Hat (Statistical).

# Question for group discussion 

What are some examples of how culture can play a role in how a student learns probability?

## Culture in probability

- differences on nature or role of randomness (Eglash, 2005)
- Culturally-relevant games (e.g., Toma Todo, la lotería, etc. vs. card games, etc.)
- Manipulatives: "fair die", "draw a card",
sides of a coin, "faces" of a coin

## Culture in probability: Manipulatives

- "fair die": not knowing what a 'fair die' was, an K-12 ELL could not answer "If you rolled a fair die, what is the probability of getting a number less than 3?"
(Yu Ren Dong, March 2016 Mathematics Teacher)
- "draw a card": two 3rd-grade students drew the 6 of spades in their math notebook
- sides of a coin:
college ELL interview excerpt (from Lesser \& Winsor, 2009):
M : The second event is 'quarter lands on tails.'
S 2 : What is tails on the quarter?
[Mexican coins: seal (or sun) and eagle;
other Latin America: cara[face] y cruz[cross], shield, crown]

## tossing (asymmetric) moon blocks

(can disrupt equiprobability bias)

- each crescent-shaped block has flat(yang) and curved(yin) sides
- used in China, Hong Kong, Taiwan, etc. to indicate - (2 yins) or + (1 of each) fortune
- What's probability of the latter?

## Specific Context: Coin Flipping

- Real-world: decided some precinct delegates in lowa political caucuses, opening NFL kickoffs, etc.
- Statistics: flips are Bernoulli trials, have the simplest equiprobable sample space, are a benchmark for randomness, etc.
- Probability education research reviewed in our 2016 SERJ paper: Falk \& Lann (2015), Rubel (2007), Sedlmeier (1998), Watson \& English (2015), etc.

# Coin-flipping can illustrate probability misconceptions 

misconception

Equiprobability bias

Gambler's fallacy

Law of Small Numbers

Representativeness Heuristic

Example: A person believes....
"exactly 3 heads" or "exactly 1 head" are equally likely for a 3-flip sequence after 9 heads, the $10^{\text {th }}$ toss is more likely to be tails
even short runs of coin flips to reflect the fairness of a coin
a sequence of coin tossing with a very long streak of heads or with a well-ordered pattern such as THTHTHTH is not representative of a random process
Availability Heuristic there are more 10-flip sequences with exactly 2 heads than with exactly 8 heads

# multilingual probability resources

# question adapted from protocol Sketch a plausible graph of the cumulative proportion of flips that are heads 

E

Milo Schield shared that a record 645+ meanings of "run" were found by Oxford English Dictionary lexicographer Peter Gilliver

## A Verb for Our Frantic Times

```
\widetilde{E}\mathrm{ www.nytimes.com/2011/05/29/opinion/29winchester.htm}
By SIMON WINCHESTER
```

THIS MORNING'S VOCABULARY QUIZ
INSTRUCTIONS: Each of the numbered clues below refers to one of the hundreds of senses in the O.E.D.'s definition of "run."

ANSWERS: 1. Run aground. 2. A run in her stocking. 3. Take the money and run. 4. Run it up the flagpole. 5. Alsoran. 6. Run a fever. 7. Running on empty. 8. Runs in the family. 9. Home run. BONUS: "Along the riverrun" from "Finnegans Wake" by James Joyce. Sam Potts

## Multiple meanings of run in statistics

- Difference of $x$-coordinates
(e.g., slope is "rise over run")
- A sequence of at least 2 consecutive identical outcomes (e.g., "what is the longest run of heads?")
- In the long run
- Run the [experiment/simulation/program]

## Multiple meanings of run in statistics

## What is a run in a designed experiment?

Learn more about Minitab 17

A run is an experimental condition or factor level combination at which responses are measured.
Usually, each run corresponds to a row in the worksheet and results in one or more response measurements, or observations. For example, you do a full factorial design with two factors, each with two levels. Your experiment has four runs:

| Run | Factor 1 | Factor 2 | Response |
| :--- | :--- | :--- | :--- |
| 1 | -1 | -1 | 11 |
| 2 | 1 | -1 | 12 |
| 3 | -1 | 1 | 10 |
| 4 | 1 | 1 | 9 |

NOTE
When doing an experiment, the run order should be randomized.

Each run corresponds to a design point, and the entire set of runs is the design. Multiple executions of the same experimental conditions are considered separate runs and are called replicates.

## Language recommendations (using Spanish as a resource!)

- replace "in the long run" by "in the long term" (en el largo plaza); sullivan (2010) uses "long-term proportion"
- replace "longest run of heads" by "largest number of successive [consecutive] heads" (el mayor número de caras sucesivas)
Also,
- replace "face of the coin" by "side of the coin" (to avoid confusion with cara[heads])

## Another reason to distinguish similar-sounding phrases

- "long run" and "longest run"
- Mean, median, mode: Lesser \& Winsor (2009) \& CLASS survey

## Pedagogical discussion

- Visuals (e.g., the sequence of flips, the bar chart of flips accumulated) help!

Coin Tossing
6 Number of tontin 100
C Longest run of heuss

Probability of heads $=0.5$

Number of tousti -100
Number of heads $=51$
Humber of tails $=43$
Longest run of hests = 5
Longest run of tails $=8$
Percentage of heads $=54$
Chanet errer = 1

MATEMATILA

Conceptos de Geometría y Medición
Funciones y Conceptos de Álgebra
Conceptos de Estadística y Probabilidad

## Probabilidad y deportes

Tiene en consideración conceptos de probabilidad con base en estadisticas de deportes profesionales.
Ideas que conducen a la probabilidad
Presenta a los estudiantes conceptos utilizados que conducen a la probabilidad.
Introducción al concepto de probabilidad
Presenta a los estudiantes conceptos sencillos de probabilidad.
Probabilidad de diagramas de árbol
Presenta el concepto de diagramas de árbol como una forma de calcular la probabilidad de un evento de varios pasos.
Probabilidad y geometría
Los estudiantes aprenden sobre cómo la probabilidad se puede representar utilizando la geometría.
Probabilidad condicional y probabilidad de eventos simultáneos
Presenta la probabilidad condicional y la probabilidad de eventos simultáneos.
Substitución y probabilidad
Amplía la noción de la probabilidad condicional mediante la discusión de los efectos de la substitución al dibuiar varios objetos.
